

Clarity Health · 3-Minute Demo Runbook

Snowflake Summit · Pediment Booth · for the recorded video walkthrough of the Clarity Health dbt-wizard demo.

3-5 days MANUAL MODEL BUILD TODAY	90 sec DBT-WIZARD BUILD	\$1.2M DENIED CLAIMS AVOIDED / YR	14 hr EARLIER THAN QUALITY COUNCIL
--	-----------------------------------	--	---

Frame the demo on business outcomes — never functionality

PAIN The CMO can't get answers in time for the Quality Council	REASON Every new question = 3-5 day DE backlog	IMPACT Denied claims, missed CMS bundles, readmission penalties	CAPABILITY Build-time AI on the governed gold layer	PROOF Live model build in 90 seconds — on screen
--	--	---	---	--

The mantra for this video: the win is not that dbt-wizard *can* author a model. The win is that the Chief Medical Officer walks into the next Quality Council with a tested, lineage-tracked answer that did not exist this morning. Every beat below ties back to that one sentence.

The 3-minute script · five beats

00:00 – 00:25 Beat 1 · The stakeholder hook WHAT YOU SAY (VERBATIM, 25S) "It is Friday morning at Clarity Health. The Chief Medical Officer needs to know: Why did sepsis bundle-compliance dip for the cardiology service line last Tuesday? The Quality Council happens in 14 hours. Today, an answer like this costs three-to-five days of data-engineering work and a missed meeting. We are about to change that."	WHAT YOU SHOW Land on the Scenario page (/scenario). The Chief Medical Officer's question banner is the first thing in frame. Let the T-minus counter tick. OUTCOME → The audience anchors on a real business question, not a data feature.
00:25 – 00:50 Beat 2 · The cost of the gap WHAT YOU SAY (25S) "There is no gold-layer mart that answers this. Three days from now, after a request, a backlog, a scope, a build, and a peer review, the engineering team might land it. The Quality Council will have already happened. Eleven cardiology fallouts means roughly \$1.2 million in denied-claims exposure this quarter alone — and that is just the dollars we can see."	WHAT YOU SHOW Stay on Scenario. Highlight the four KPI tiles: Manual ETA · 3-5 days, dbt-wizard ETA · 90 sec, \$1.2M at risk, T-minus to Quality Council. Slowly hover the "Manual ETA" tile. OUTCOME → Quantifies the business cost of the gap. Sets up the 90-second proof point.

00:50 – 02:20 Beat 3 · The live build (the proof moment)

WHAT YOU SAY (90S)

"We click *Run the Build*. Four sub-agents — *Explorer*, *Summary*, *Worker*, *Verification* — open the dbt project, find the right grain, pull a slice of the underlying gold layer, write the new model, write its tests, and materialize it. The viewer sees the SQL appear character by character. By the time we are done talking, the model exists, the tests have passed, and the lineage graph has updated."

While narrating, pause once at: "Worker is anchoring the CTE to the grain the Chief Medical Officer asked for — not a notebook-grade approximation." Then pause again at: "Verification is writing a uniqueness test on the natural key. This is a governed gold asset, not a SQL snippet pasted into Slack."

WHAT YOU SHOW

Click into [/wizard-live](#). Let the playback run at 1x — do not bump speed. The agents type the SQL and YAML in real time. Step rail moves through Discovery → Schema → Inspection → Model Creation → Test Authoring → Materialization. The terminal-window aesthetic looks like Claude Code.

OUTCOME → Audience sees the build-time AI work end-to-end. The "wow" is not the typing animation — it is the realization that the output is a tested, governed asset.

02:20 – 02:45 Beat 4 · The outcome (tie to the P&L)

WHAT YOU SAY (25S)

"The new mart is materialized. The Quality Council convenes in 14 hours, not three days. The Chief Medical Officer walks in with the answer: lactate-redraw orders not auto-firing on shift change for ER-admitted patients between 7-8am — 11 of 14 cardiology fallouts share this signature. That is a workflow fix, not a six-month staffing initiative. And the next time anyone asks this question — Cardiology, Neurology, anywhere, anywhere — the model is already there."

WHAT YOU SHOW

Cut to [/outcome](#). Show: materialized model card with row counts, tests passed, lineage updated, the root-cause insight panel, and the impact panel.

OUTCOME → Closes the loop from question to action. The model is reusable — first build pays for the second, third, tenth.

02:45 – 03:00 Beat 5 · The architectural ask

WHAT YOU SAY (15S)

"Fivetran lands every Clarity Health source. dbt governs the layer. dbt-wizard authors the gaps. Snowflake reads it. That loop closes for clinical-quality questions, denied-claims investigations, readmission deep-dives, and CMS audit prep — all on the same governed lake. Want to see how this maps to your gold layer? Stop by the Pediment booth or scan the QR."

WHAT YOU SHOW

Final card with the four-pillar loop, QR code to [fivetran.com/contact](#) or the booth landing page. Tag dbt Labs co-brand.

OUTCOME → Calls out the architectural pattern (not a feature). Invites a discovery conversation.

Business outcomes to weave through — never lead with features

OUTCOME THE BUYER FEELS	WHAT IT REPLACES	HOW TO PHRASE IT IN THE DEMO
Quality Council gets the answer same-day	3-5 day DE backlog	"In time for the meeting, not three days late"
\$1.2M denied-claims exposure addressed in 90 seconds	Lost claims, retroactive appeals	"The cost of the gap closed before lunch"
Reusable governed mart for every future ask	One-off notebook scripts	"The next person who asks gets it for free"
CDO doesn't add headcount to keep up	Hiring DE backfill	"Your team stops being the bottleneck"
Auditor sees lineage + tests, not a query history	Manual evidence packs	"Examiner-ready by default"

Anti-patterns · what NOT to say

- **Don't say:** "It runs dbt show against the warehouse and authors a new model file." **Say:** "Ninety seconds from question to materialized answer."
- **Don't say:** "Cortex Analyst." Cortex is intentionally absent from this demo. The story is build-time AI on the governed lake.
- **Don't say:** "dbt-wizard generates SQL." Say: "dbt-wizard authors a governed asset — schema contract, tests, lineage, ownership."
- **Don't say:** "Look at the typing animation." The animation is the texture, not the value.
- **Don't open with the architecture diagram.** Open with the Chief Medical Officer's question. Architecture is the closer.

Discovery prompts to anchor before the demo (if presenting live)

BEFORE YOU PRESS PLAY

- "What questions does your CMO ask that your team can't answer same-day?"
- "When a stakeholder asks for a new cut of CMS data, what is the average time from ask to merged dbt model?"
- "How many one-off SQL scripts are sitting in someone's Snowflake history that never made it back into the governed layer?"
- "Who is your Economic Buyer for clinical-quality reporting — CMIO, CDO, COO, or the Quality Office?"

AFTER THE DEMO LANDS

- "Which of those agent steps — discovery, schema, data inspection, model authoring, test authoring, materialization — is the one your team spends the most time on today?"
- "If we sized a pilot on three of your highest-value recurring stakeholder questions, what would success look like in 90 days?"
- "Who needs to be in a 30-minute architecture review to see how this lands on your gold layer? Likely audience: CMIO, CDO, COO, or the Quality Office."

Required follow-up materials

- One-pager · Clarity Health · at fivetran-jasonchletsos.github.io/Fivetran-Demo-Repository/one-pager/healthcare-epic/
- Live demo URL · fivetran-jasonchletsos.github.io/Healthcare-EPIC-Snowflake-Demo/
- 3-minute walkthrough video (this recording)
- Architecture diagram on the Architecture tab of the demo
- Cross-industry credibility · Pediment Bank (Banking flavor of the same loop)

Booth-floor reminder: the demo is built to run unattended for booth visitors. If a prospect walks up mid-playback, do not restart. Pick up the narration where the playback is — that is also the point. The build finishes whether someone is watching or not. That is the entire pitch.
